5th Historic Mortars Conference – HMC 2019
Pamplona, 19th-21st June 2019

This 5th HMC is a RILEM co-sponsored event and the organization has been supported in part by the Ministry of Economy and Competitiveness (MINECO) under project MAT2015-70728-P. The companies Puma Group, Heidelberg Cement, Saint-Astier, Kerakoll, Lhoist, Gordillos Cal de Morón, SINT Technology have provided funds.

INDEX

Foreword.....	1
Inaugural Conference	5
<i>Historic mortars of the Holy Aedicule and the Tomb of Christ supporting the design and evaluation of performing and compatible restoration mortars and revealing the history of the monument</i>	5
Topic 1.....	9
Earth-based plasters and mortars on archaeology and historic constructions	9
Earth-based plasters: the effect of anhydrite stabilization	11
<i>José Lima; Afonso Lino; Teresa Freire; Isabel Pombo; Paulina Faria</i>	
Similar appearance of mortar and brick masses in Algiers Casbah houses during the Ottoman period (16 th - early 18 th centuries)	12
<i>Semha Bernou; Tsouira Kassab; Rosa Bustamante; Francisco Fernández</i>	
Assessment of adhesive strength of an earth plaster on different substrates through different methods	13
<i>Paulina Faria; José Lima; João Nabais; Vitor Silva</i>	
Earth-based plasters: the influence of clay mineralogy.....	14
<i>José Lima Ferreira; Paulina Faria; António Santos Silva</i>	
Earth-based and binder-based mortars comparison	15
<i>José Lima; Paulina Faria; Rosario Veiga</i>	
Earth-based and current plasters: assessment of efficiency and contribution to indoor air quality	16
<i>Tânia Santos; Maria Idália Gomes; Flávia Coelho; Paulina Faria</i>	
Earthen plasters based on illitic clayish earth – the influence of calcitic lime addition	17
<i>José Lima; Paulina Faria; Rosario Veiga</i>	
Rescuing the manufacturing process of traditional mortars present on XIX-century earthen buildings in Brazil.....	18
<i>Andrea Cavicchioli; Isabela Ferreira Sodr� dos Santos; Jo�o Guilherme Kimura Moreira; Lucy Gomes Sant’Anna</i>	
Macroscopic high resolution techniques to the characterization of the mortars structures in the S�-Cathedral’s archaeological complex in Idanha-a-Velha (Portugal).....	19
<i>Pablo Guerra Garc�a; Jorge Mor�n de Pablos; Isabel S�nchez Ramos</i>	
Topic 2.....	21
Use of nanotechnology for high performance mortars	21
Enhancing clay mortars’ properties.....	23
<i>Aspasia Karozou; Maria Stefanidou</i>	
Active photocatalytic-superhydrophobic coating with TiO₂-ZnO nano-heterostructures for lime mortars	24
<i>A. Speziale; J.F. Gonz�lez-S�nchez; I. Navarro-Blasco; J.M. Fern�ndez; J.I. Alvarez</i>	
Evaluation of SiO ₂ nanoparticles as additive for lime mortars: changes in the microstructure and mechanical properties	25
<i>Mar�a del Mar Barbero-Barrera; Aranzazu Sierra Fern�ndez; Duygu Ergenc; Luz Stella G�mez Villalba; Rafael Fort</i>	
Evaluation of the influence of nano-SiO ₂ and nano-Al ₂ O ₃ in physico-mechanical properties and microstructure of calcareous clay	26
<i>Eirini-Chrysanthi Tsardaka; Maria Stefanidou</i>	
Studies of the mechanical properties of lime mortars treated with alkaline earth hydroxide nanoparticles.....	27
<i>P.I. Girginova; C. Galacho; R. Veiga; A.S. Silva; A. Candeias</i>	
Synthesis of nanolime in sugary solutions.....	28
<i>Sagrario Mart�nez-Ram�rez; Laura R. Higuera; Ignacio Cascales; Mois�s Mart�n-Garrido; Maximina Romero</i>	
The use of nanoparticles to improve the performance of restoration mortars	29
<i>Beatriz Men�ndez; Dita Frankeov�; Jos� Diaz; Radek �ev�ik; Petra M�cov�; Mouna Faiz; Zuzana Sl�zkov�</i>	
Study of the role of different nanoparticles in lime pastes	30
<i>Eirini-Chrysanthi Tsardaka; Maria Stefanidou</i>	

Active photocatalytic-superhydrophobic coating with TiO₂-ZnO nano-heterostructures for lime mortars

Abstract

Active coatings to be applied onto hardened surfaces of lime rendering and masonry mortars and stones of the Built Heritage were developed. Nano-heterostructures of TiO₂-ZnO (50:50 and 10:90) were obtained by Flame Spray Pyrolysis as photocatalytic agents with expanded sensitivity towards solar light, instead of the restricted UV dependence of the pure TiO₂ or ZnO. A superhydrophobic medium was simultaneously prepared and photocatalytic nanoparticles were added to obtain the coatings. The active products were expected to prevent the water absorption of the substrates and the subsequent degradation effects as well as to allow the stones and mortars to act as self-cleaning materials, reducing the dirt deposition and the biological colonization. Dispersions were applied onto the surface of lime mortars and siliceous stone. Measurements of the photocatalytic oxidation activity of the coatings were carried out by means of the NO degradation, showing a very good efficiency of the nanoparticles even at long term tests (values of NO oxidation of ca. 35%). Water contact angle (WCA) assessment evidenced a strong hydrophobization of the treated surfaces, with WCA values higher than 140°. The results proved the synergistic effect of these coatings with respect to the durability of the treated substrates, giving rise to a promising way of preventive conservation for building materials of the Cultural Heritage.

Keywords

Lime Mortars; Nanoparticles; Photocatalytic Activity; Coatings

Acknowledgments

Funded by MINECO under Project MAT2015-70728-P, and by the Government of Navarra under grant number Exp. 0011-1383-2018-000005, project PC065 RECURBAN. J.F. González-Sánchez thanks the Friends of the University of Navarra, Inc., for a pre-doctoral grant.
